

Bug on iOS 9.3

Issue: KDC does not connect to application in MFi mode. The KDC will pair to the host, display “Waiting” then “Connected”, but does not connect in KTSync (or other application).

How to replicate: On the host device go to Settings > General > Reset > Erase All Content and Settings. After this is finished the issue appears.

Workaround: Restore the host device.

1. Connect device to PC with iTunes.
2. Underneath the device summary, the user has the option to Restore Device or Restore a Backup if one is previously saved.
 - The ‘Find My iOS iPad/iPod/iPhone’ feature must be disabled in order to restore the device. Go to the iCloud settings on the device to disable this feature.
3. Once the restore is complete, the KDC will resume normal functionality.
